

EMTrack® 5.1.10 Release Notes

These notes describe enhancements introduced in the EMTrack 5.1.10 release scheduled for Monday, February 1, 2021. More information is available through your solution or by contacting the Juvare Support Center at 877-771-0911 or support@juvare.com.

Patient Forms

When creating or editing patient forms, administrators are now able to make the Medication Administered component required. This means clinicians and responders entering patient information will need to include details about the medications they have administered.

Date of Birth Validation

When importing date of birth information, for example by scanning an identification card, the date is now validated for accuracy. To reduce the proliferation of errors, any date over 120 years or in the future will not be accepted and the field will appear blank as if no information has been entered.

Resolutions

Resolved minor issues related to usability and navigation.
