

EMTrack® 5.4 Release Notes

These notes describe enhancements introduced in the EMTrack 5.4 release scheduled for Wednesday, March 24, 2021. More information is available through your solution or by contacting the Juvare Support Center at 877-771-0911 or support@juvare.com.

Configurable Notification Templates

Notification content is now configurable. Notification templates were added to the System Settings, under Other Settings, that allow administrators to create, edit, and manage the name, subject, and body of notifications. Likewise, templates can be marked active or inactive. Templates support dynamic content, such as patient name, vaccine administered, and appointment location. Offering direct control over the notifications sent through EMTrack means messages can be customized to better meet your situation and needs.

New Filtering Options

Several new filtering options were added to EMTrack to improve searches and search results related to vaccinations, including ticket ID, order number, event, and more. Also, you can now filter by whether a value is filled in (for example, show patients with date of birth).

Numeric Answers on Screening and Pre-Screening Questions

In addition to the previously accepted answers (yes, no, and unknown), screening and pre-screening questions on patient forms now support numeric answers too.

Vaccination Registry Integration

Two new data fields, Site and Administered by, were added to the state vaccination registry integration. These new fields now transmit vaccination-specific data that is entered through the Medication Administered component on patient forms to integrated state registries.

Vaccination Reporting Metrics

Through the Reports tab, several new reports can be generated that document overall patient counts, as well as specific reports by gender, race, and ethnic group. These new reports provide heavily requested information and insight into vaccination distribution.
