

Ad-Hoc Notifications Plug-In 1.20.0 Release Notes

These notes describe enhancements introduced in the Ad-Hoc Notifications Plug-In 1.20.0 release for eICS that is scheduled for Wednesday, June 16, 2021. More information is available through your solution or by contacting the Juvare Support Center at 877-771-0911 or support@juvare.com.

Notification Type

When creating a notification, you can identify the notification type – actual or test – to categorize the notification. These categories help you locate and distinguish notifications.

Stop a Notification

Now, you can stop a notification that has already been sent. Stopping a notification does not recall notifications that have already been delivered, but rather, it stops the solution from sending any more notifications. This feature is most effective when sending notifications in escalate mode, where notifications are sent to one delivery method at a time.

Display Sender Name

Emails received through Ad-Hoc Notifications now display the name of the sender in the from section of the email.

Resolutions

Minor issues related to usability and navigation were resolved.
