EMSupply™ 1.4 Release Notes

These notes describe highlights of the EMSupply 1.4 release scheduled for Tuesday, December 23, 2019. More information is available through your solution or by contacting the Juvare Support Center at 877-771-0911 or support@juvare.com.

Manufactured Kits

Introduced manufactured kits to simplify the process of managing prepackaged inventory items. Using a template that identifies the kit contents, you can add large quantities of items that are bundled in a kit, yet trackable individually.

For example, adding 10 bleeding control kits that each contain two pairs of gloves, a tourniquet, two packs of gauze, and a shears, is reflected in your inventory list with 20 gloves, 10 tourniquets, 20 gauze, and 10 shears. However, these items are not available for on-hand or individual use because they are identified as belonging to kits.

However, once distributed, the kit can be consumed as a whole or individual items in the kit can be consumed. If only part of the kit is consumed, the kit can be disassembled to make the remaining items available for use individually or the missing items can be deducted from inventory, the items can be replaced, and refilled kits can be sent to quality control for verification and restocking.

Categories

Enhanced the look and feel of the category tree, making it easier to view, navigate, and locate categories, item types, items, and attributes.

Notifications

Updated notifications to include inventory items that are below the reorder and/or par quantities. These quantities are specified when inventory is entered, and items can be edited to update this number. These notifications are sent to Regional and Facility Administrators on a monthly or weekly, according to settings on your profile, and they are accessible on the Notifications page.
