

EMSupply™ 1.9 Release Notes

These notes describe highlights of the EMSupply 1.9 release scheduled for Wednesday, July 22, 2020. More information is available through your solution or by contacting the Juvare Support Center at 877-771-0911 or support@juvare.com.

Online Help

Implemented a new integrated and task-focused Online Help system. By replacing the static version of Help, Online Help gives you easier access to topic-oriented, procedural, and reference information, offering you greater value by providing enhanced search capabilities, reducing the time spent searching for vital information, and eliminating the need to contact live support.

Resource Requests

Added the capability to make status changes for multiple (bulk) Resource Requests at one time, allowing you to simplify your tasks and save time associated with manual updating.

Manage Inventory

Improved navigation within the solution. You can now navigate to different locations using the global domain switcher without having to return to the Manage Inventory page. You can also search locations for information in the Manage Inventory page, regardless of the location in the global domain drop-down list.

Resolutions, Improvements, and Enhancements

- Resolved an issue causing a warning message to display when creating or updating information related to a Region, Location, or Sublocation. A warning message no longer displays when information in these regions is created or updated.
- Made general enhancements to better optimize and improve overall solution performance.
